

Intelligent by design - The Servo driven Pack Stacker

Setting new standards of performance, setup and change over speed.

CONVERGING 
SOLUTIONS 

Converging Solutions Pack Stacker

Converging Solutions are pleased to announce their New Pack Stacker, the Pack Stacker is a versatile unit for the automatic stacking of packs. With the advent of higher speed lines driven by the quest for ever increasing efficiency and lower production costs our machines are designed to minimise human intervention and dramatically reduce labour costs.

OPERATOR WELFARE

Helps reduce the ongoing effects of RSI by reducing the number of packs handled by the packing operators

QUALITY

Improves quality control as it will no longer be necessary to accumulate packs using an accumulation table which can cause both product aging and damage issues.

EFFICIENCY

Designed to handle high throughput speeds and present them to the packaging team at a manageable stack rate rather than an individual pack rate, allowing for quick and convenient transferral to outer packaging.

VERSATILITY

Can be configured to suit virtually any style of preformed packs and can be programmed to receive and stack a variety of different pack stack heights on the same line with minimal changeover time required. Product recipes are stored in the machine with access to different programs via a simple touch of the HMI.
